

## **5A Single Cell Li-Ion Switching Battery Charger with Direct Charge, Power Path Management and USB OTG Boost Mode**

### **General Description**

The RT9468 is a switch-mode single cell Li-Ion/Li-Polymer battery charger for portable applications. It integrates a synchronous PWM controller, power MOSFETs, input current sensing and regulation, high-accuracy voltage regulation, and charge termination. The charge current is regulated through integrated sensing resistors. The RT9468 also features USB On-The-Go (OTG) support. The RT9468 integrates an easy-to-use direct charge function, simply driving an external MOSFET to enable a direct charge path, as well as over-voltage protection, over-current protection, and watchdog functions.

The RT9468 optimizes for charging task by using a control algorithm to vary the charge rate for different modes, including pre-charge mode, fast charge mode (constant voltage and constant current). The key charge parameters are programmable through an I<sup>2</sup>C interface. The RT9468 will resume the charge cycle whenever the battery voltage falls below an internal recharge threshold, and can automatically enter sleep mode if the input power supply is removed.

Other features include under-voltage protection, over-voltage protection, thermal regulation and reverse leakage protection.

The RT9468 is available in a WQFN-32L 4x4 package.

### **Applications**

- Cellular Telephones
- Personal Information Appliances
- Tablet PC, Power Bank
- Portable Instruments

### **Features**

- **Direct Charge with Over-Voltage Protection, Over-Current Protection and Watchdog**
- **High Efficiency 5A, 1.5MHz Switching Charger with Output Inductor DFE252012F, TOKO**
  - **Charging Efficiency 90.25% at ICHG = 2A**
  - **Charging Efficiency 88.86% at ICHG = 3A**
  - **Charging Efficiency 84.2% at ICHG = 5A**
- **Synchronous 1.5MHz/0.75MHz Fixed-Frequency PWM Controller with Up to 95% Duty Cycle**
- **Power Path Management by BATFET Control**
- **Support High Voltage Input (9V/12V)**
- **Support High Voltage Input Adapter (Pump Express 1.0/2.0/3.0)**
- **Support IR Compensation Function from Charger Output to Cell Terminal**
- **Optimize Input Sourcing Capability to Prevent Overload**
  - **AICR Current Limit Setting via I<sup>2</sup>C**
  - **ILIM Pin for Current Limit Setting**
  - **Average Input Current Limit Measurement**
- **Shipping Mode for Battery Leakage Reduction**
  - **Wake Up System, Exit Shipping Mode, and Reset System by QON Pin**
- **Automatic Charging**
- **Average Input Current Regulation (AICR) :**  
**0.1A to 3.25A in 50mA Steps**
- **Charge Current Regulation Accuracy : ±7%**
- **Charge Voltage Regulation Accuracy : ±1% (0 to 85°C)**
- **Protection for Overall System Considerations**
  - **Thermal Regulation for Current Reduction and Over-Temperature Protection**
  - **Input Over-Voltage Protection**
  - **Input Bad Adapter Protection**
  - **Battery Over-Voltage Protection**
- **Support ADC Conversion for**
  - **VBUS, VBAT, VSYS, REGN, TS\_BAT, IBUS, IBAT, TEMP\_JC, TS\_BUS,VBATS, IBATS**
- **INT Output for Communication with Host Through I<sup>2</sup>C (Watch Dog / Polling Function)**

## Ordering Information

RT9468 □ □

- Package Type  
QW : WQFN-32L 4x4 (W-Type)
- Lead Plating System  
G : Green (Halogen Free and Pb Free)

Note :

Richtek products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

## Pin Configuration

(TOP VIEW)

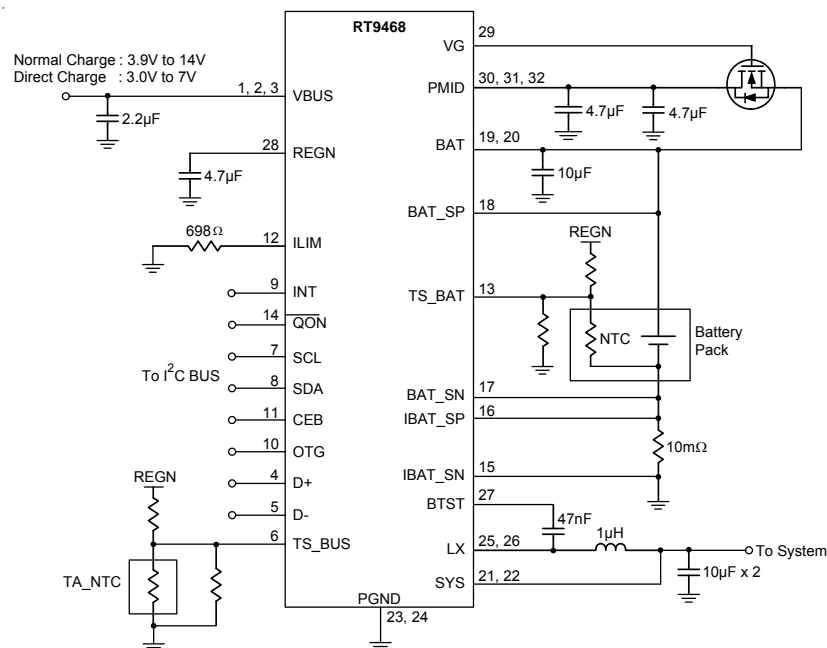

WQFN-32L 4x4

## Marking Information

5F= : Product Code  
YMDNN : Date Code

## Typical Application Circuit

Below are recommended components information

Pin	Description	Part Number	Package	Manufacturer
VBUS	2.2µF/25V/X5R	GRM155R61E225KE11	0402	muRata
PMID	4.7µF/25V/X5R	GRM188R61E475KE11	0603	muRata
BTST	47nF/16V/X5R	GRM033R61C473KE84	0201	muRata
SYS	10µF/6.3V/X5R	GRM185R60J106ME15	0603	muRata
REGN	4.7µF/6.3V/X5R	GRM155R60J475ME47	0402	muRata

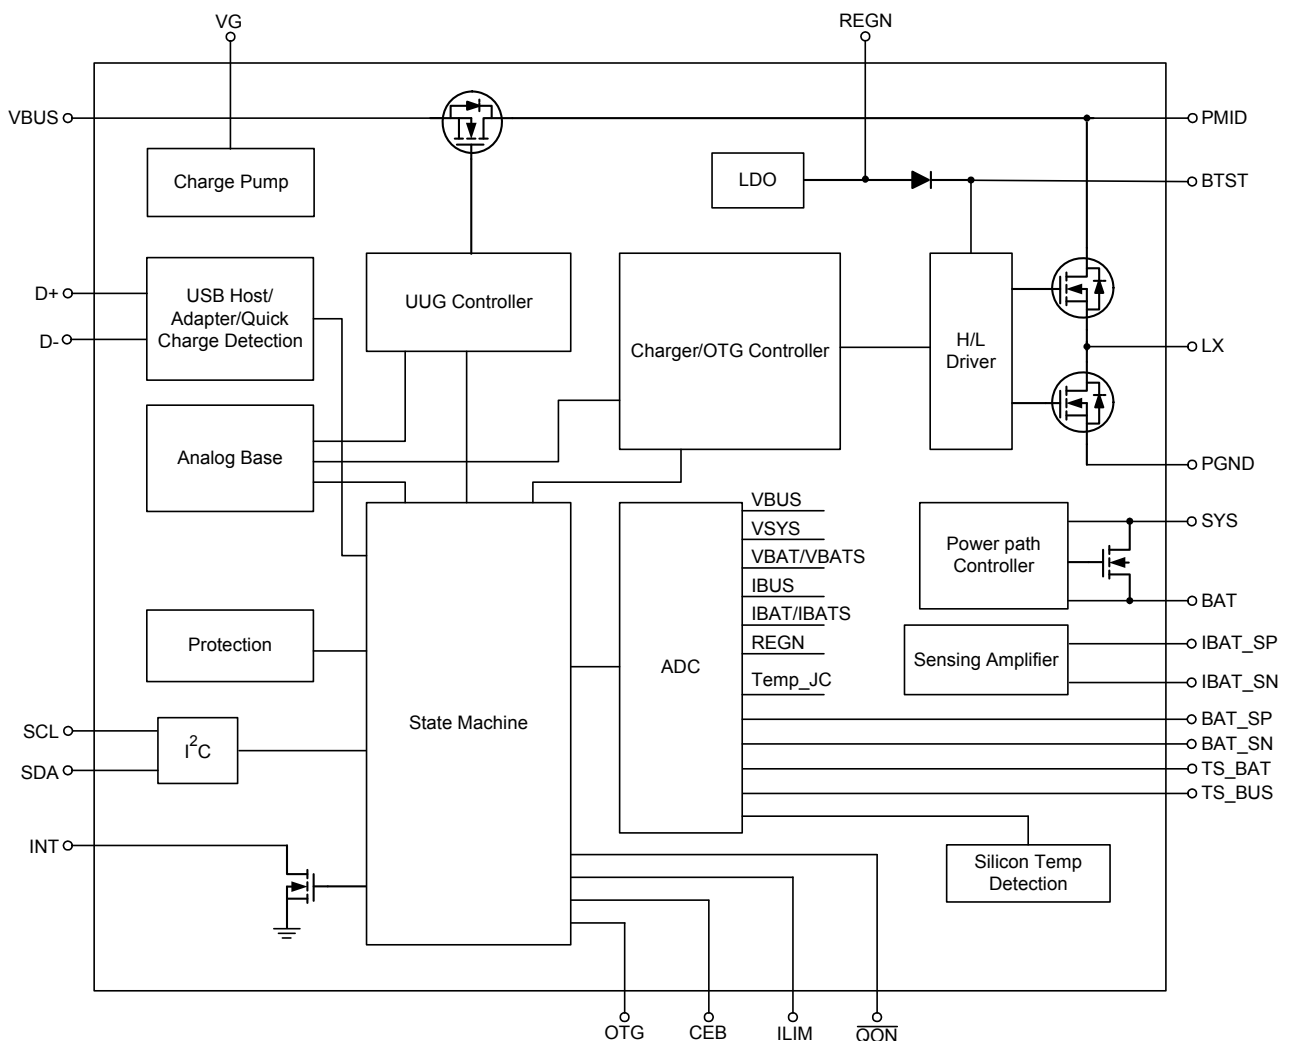

Pin	Description	Part Number	Package	Manufacturer
BAT	10 $\mu$ F/6.3V/X5R	GRM185R60J106ME15	0603	muRata
LX	1 $\mu$ H/20%	DfE252012F-1R0	2.5 x 2.0mm	TOKO
VG	NMOS	DMT2004UFDF_R0	2.0 x 2.0mm	DIODES
ILIM	698 $\Omega$ /1%	RR0306S-6980-FNH	0201	CYNTEC

## Functional Pin Description

Pin No.	Pin Name	Pin Description
1, 2, 3	VBUS	Power input.
4	D+	USB D+ Port Connected to USB Receptacle.
5	D-	USB D- Port Connected to USB Receptacle.
6	TS_BUS	BUS temperature-sense input, connected to a resistor divider for temperature programming. If there is no need for the battery temperature-sense function, a 50k $\Omega$ resistor is connected to REGN and another 50k $\Omega$ resistor to ground.
7	SCL	I <sup>2</sup> C interface serial clock input. Open-drain. An external pull-up resistor is required.
8	SDA	I <sup>2</sup> C interface serial data input/output. Open-drain. An external pull-up resistor is required.
9	INT	Interrupt output, active-low open-drain. Indicator of the charger/boost event for system processor.
10	OTG	OTG boost mode enable control, active-high. Act with OTG_PIN_EN (0x01[1]).
11	CEB	Charger enable input, active-low.
12	ILIM	Input current limit setting pin. A resistor is connected from ILIM pin to ground to set the maximum input current limit. The actual input current limit is the lower value set through the ILIM pin and IAICR register bits.
13	TS_BAT	Battery temperature-sense input, connected to a resistor divider for temperature programming. If there is no need for the battery temperature-sense function, a 50k $\Omega$ resistor is connected to REGN and another 50k $\Omega$ resistor to ground.
14	$\overline{\text{QON}}$	Internal BATFET enable control input. In shipping mode, $\overline{\text{QON}}$ is pulled Low for the duration of t <sub>SHIPMODE</sub> (typical 0.9s) to exit shipping mode.
15	IBAT_SN	Negative battery current sense.
16	IBAT_SP	Positive battery current sense.
17	BAT_SN	Negative battery voltage sense.
18	BAT_SP	Positive battery voltage sense.
19, 20	BAT	Battery connection node. Charging current output node. Internal BATFET is connected between SYS and BAT.
21, 22	SYS	System connection node. The internal BATFET is connected between SYS and BAT. Connect a 20 $\mu$ F ceramic capacitor between SYS and ground.
23, 24	PGND	Power ground connection.
25, 26	LX	Switch node for output inductor connection.
27	BTST	Bootstrap capacitor connection for high-side gate driver. Connect a capacitor from BTST to LX to power the internal gate driver.

Pin No.	Pin Name	Pin Description
28	REGN	Regulated output voltage to supply for the PWM low-side gate driver and the bootstrap capacitor. Connect a 4.7 $\mu$ F ceramic capacitor from REGN to GND. 1.If VBUS is plugged in, REGN will be powered by VBUS and regulated to 4.9V. 2.If VBUS is unplugged, the charger will operate in sleep mode and the REGN voltage will be 0V. * For #2. : Since the REGN voltage is also used to power the TS resistor, when the charger is in sleep mode, the REGN will be woken up (be reactivated) if VBAT is greater than forward voltage ( $V_F$ ) of the internal high-side (HS) MOS diode by VSLEEP_EXIT with all function of the internal ADC being activated and I <sup>2</sup> C R/W. The REGN wake-up time is 500ms.
29	VG	Gate driver output for external N-MOSFET.
30, 31, 32	PMID	Connection point between the reverse blocking MOSFET and the high-side switching MOSFET.
33 (Exposed Pad)	PGND	Power ground. The exposed pad must be connected to GND and well soldered to a large PCB copper area for maximum power dissipation.

## Functional Block Diagram

## Operation

The RT9468 is an integrated single cell Li-ion battery switching charger with power path controller.

### Base Circuits

Base circuits provide the internal power, VREGN and reference voltage and bias current.

### Protection Circuits

The protection circuits include the VINOVP, VINUVLO, BATOVP and OTP circuits. The protection circuits turn off the charging when the input power or die temperature is in abnormal level.

### Buck Regulator for Charging and Boost Regulator as OTG

The multi-loop controller controls the operation of charging process and current supply to the system. It also controls the circuits as a Boost converter for OTG applications.

### Battery Detection

The RT9468 is capable of doing the battery absence detection. The detection protects the charger when battery is removed accidentally.

### Adapter Detection

If the poor input power source is connected to the RT9468, the operation will be shut down by the adapter detection.

### Power Path Management and Control

Once the battery voltage increases to a defined system minimum regulation voltage, the internal path between SYS and BAT will be fully turned on. That is, a better charging efficiency can be achieved. When end of charge occurs, the charging will stop and the internal path will be turned off.

### USB Charger Detection

The RT9468 can detect and distinguish Standard Downstream Port, Charging Downstream Port and Dedicated Charging Port via DP and DM pins.

### TS Detection

The RT9468 detects the temperature of the battery pack via REGN and TS pins. The REGN pin provides a constant voltage source to drive the voltage divider composed of a pulled-high resistor and a NTC resistor. The RT9468 reports the sensing results via IRQ and status bits for COLD, COOL, WARM and HOT.

### I<sup>2</sup>C Controller

The key parameters of charging and OTG are programmable through I<sup>2</sup>C commands.

**Absolute Maximum Ratings** (Note 1)

• Supply Input Voltage, V <sub>BUS</sub> -----	-0.3V to 22V
• Supply Input Voltage, V <sub>BUS</sub> (Peak <100ns duration) -----	-2V
• PMID, BTST -----	-0.3V to 22V
• LX -----	-0.3V to 16V
• LX (Peak < 100ns duration) -----	-2V
• PMID – V <sub>BUS</sub> , BTST – LX -----	-0.3V to 6V
• Other Pins-----	-0.3V to 6V
• Power Dissipation, P <sub>D</sub> @ T <sub>A</sub> = 25°C	
WQFN-32L 4x4 -----	3.59W
• Package Thermal Resistance (Note 2)	
WQFN-32L 4x4, $\theta_{JA}$ -----	27.8°C/W
WQFN-32L 4x4, $\theta_{JC}$ -----	7°C/W
• Lead Temperature (Soldering, 10 sec.)-----	260°C
• Junction Temperature-----	150°C
• Storage Temperature Range -----	-65°C to 150°C
• ESD Susceptibility (Note 3)	
HBM (Human Body Model)-----	2kV

**Recommended Operating Conditions** (Note 4)

• Supply Input Voltage-----	4V to 14V
• Maximum Input Current (V <sub>BUS</sub> ), I <sub>AICR</sub> -----	3.25A
• Maximum V <sub>BUS</sub> to PMID Current-----	6A
• Maximum SYS Output Current (SW), I <sub>SYS</sub> -----	5A
• Maximum Battery Voltage, V <sub>BAT</sub> -----	4.71V
• Maximum I <sub>BAT</sub> Fast Charging Current -----	5A
• Maximum I <sub>BAT</sub> Discharging Current -----	6A
• Maximum I <sub>BAT</sub> Discharging Current peak, 1sec duration -----	9A
• Junction Temperature Range-----	-40°C to 125°C
• Ambient Temperature Range-----	-40°C to 85°C

**Electrical Characteristics**

(V<sub>BUS</sub> = 5V, V<sub>BAT</sub> = 4.2V, L = 1μH, C<sub>IN</sub> = 2.2μF, C<sub>BATS</sub> = 10μF, T<sub>A</sub> = 25°C, unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
<b>Quiescent Current</b>						
V <sub>BUS</sub> Supply Current	I <sub>VBUS_SW</sub>	V <sub>LX</sub> is switching, V <sub>BUS</sub> = 5V, V <sub>SYS</sub> = 3.8V	--	8	--	mA
	I <sub>VBUS_NON_SW</sub>	V <sub>LX</sub> is non-switching, V <sub>BUS</sub> = 5V, V <sub>SYS</sub> = 4.4V	--	--	5	mA
	I <sub>VBUS_HZ</sub>	V <sub>LX</sub> is in high-impedance mode, V <sub>BUS</sub> = 5V, V <sub>SYS</sub> = 3.8V	--	--	150	μA
Battery Leakage Current	I <sub>BAT_LEAK</sub>	Power path is off, V <sub>BAT</sub> = 4.2V	--	--	25	μA
Boost-Mode Battery Discharge Current	I <sub>BAT_BOOST_SW</sub>	V <sub>BAT</sub> = 4.2V, boost mode, I <sub>VBUS</sub> = 0A, V <sub>LX</sub> is switching	--	5	--	mA

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
VBUS / VBAT Power-Up						
Sleep-Mode Entry Threshold, VBUS-VBAT	VSLEEP_ENTER	2.5V < VBAT < VOREG, VBUS falling	0	40	100	mV
Sleep-Mode Exit Threshold, VBUS-VBAT	VSLEEP_EXIT	2.5V < VBAT < VOREG, VBUS rising	40	100	200	mV
Direct Charge Sleep-Mode Entry Threshold, VBUS-VBAT	VSLEEP_ENTER_DC		--	--	40	mV
Direct Charge Sleep-Mode Exit Threshold, VBUS-VBAT	VSLEEP_EXIT_DC		40	--	--	mV
Sleep-Mode Exit Deglitch Time	tD_SLEEP_EXIT	Exit sleep-mode	--	120	--	ms
VBUS Bad Adapter Threshold	VBAD_ADP		--	3.8	--	V
VBUS Bad Adapter Hysteresis	VBAD_ADP_HYS		--	150	--	mV
VBUS Bad Adapter Sink Current	IBAD_ADP_SINK		--	50	--	mA
VBUS Bad Adapter Detection Time	tBAD_ADP_DET		--	30	--	ms
Input Current Limit Factor	KILIM	Input current regulation 508mA by ILIM pin with resistance = 698Ω	320	355	390	AΩ
Input Current Limit Regulation	ILIM_MIN	Minimum input current for regulation on ILIM pin	0.5	--	--	A
Input Power Regulation						
Minimum Input Voltage Regulation (MIVR) Threshold Range	VMIVR	I²C programmable in 0.1V steps	3.9	--	13.4	V
Default Minimum Input Voltage Regulation Threshold	VMIVR_DEF	Default	--	4.4	--	V
Minimum Input Voltage Regulation Accuracy	VMIVR_ACC	VMIVR = 4.4V, 9V	–3	--	3	%
Average Input Current Regulation Accuracy	IAICR_ACC	USB charge mode, IAICR = 100mA	86	93	100	mA
		USB charge mode, IAICR = 500mA	440	470	500	
		USB charge mode, IAICR = 1000mA	880	940	1000	mA
		Adapter 1.5A charge mode, IAICR = 1500mA	1300	1400	1500	mA
Direct Charge						
Direct Charge UC Level	IDIRCHG_UC		--	650	--	mA
Direct Charge OV Level	VDIRCHG_OV	(VDIRCHG_Rising – VOREG)/VOREG	104	108	112	%

IBAT Resolution	I <sub>IBAT</sub> ADC_RES		--	50	--	mA
IBAT Accuracy	I <sub>IBAT</sub> ADC_ACC	ICHG[5:0] setting ≥ 1000mA	-2	--	2	LSB
TEMP_JC Measurement Range	T <sub>TEMP_JC</sub> ADC_Range		-40	--	120	°C
TEMP_JC Resolution	T <sub>TEMP_JC</sub> ADC_RES		--	2	--	°C
TEMP_JC Accuracy	T <sub>TEMP_JC</sub> ADC_ACC	Temperature < 85 °C	-2	--	2	LSB
VBATS Measurement Range	V <sub>VBATS</sub> ADC_Range		0	--	4.9	V
VBATS Resolution	V <sub>VBATS</sub> ADC_RES		--	5	--	mV
VBATS Accuracy	V <sub>VBATS</sub> ADC_ACC		-2	--	2	LSB
TS_BUS Measurement Range	Rate <sub>TS_BUS</sub>		0	--	100	%
TS_BUS Resolution	Rate <sub>TS_BUS</sub> RES		--	0.25	--	%
TS_BUS Accuracy	Rate <sub>TS_BUS</sub> ACC		-2	--	2	LSB
IBATS Measurement Range	I <sub>IBAT</sub> ADC_Range		0	--	5	A
IBATS Resolution	I <sub>IBAT</sub> ADC_RES		--	50	--	mA
IBATS Accuracy	I <sub>IBAT</sub> ADC_ACC		-2	--	2	LSB
<b>External N-MOSFET Selection Specification</b>						
On-Resistance for DS Path	R <sub>DS(ON)</sub>	V <sub>GS</sub> = 4.5V	--	7	--	mΩ
Drain-to-Source Voltage (AMR)	V <sub>DS</sub>		--	--	24	V
Gate-to-Source Voltage (AMR)	V <sub>GS</sub>		-12	--	12	V
Continuous Drain Current	I <sub>D</sub>	V <sub>GS</sub> = 4.5V	8	10	--	A

- Note 1.** Stresses beyond those listed “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.
- Note 2.**  $\theta_{JA}$  is measured under natural convection (still air) at  $T_A = 25^\circ\text{C}$  with the component mounted on a high effective-thermal-conductivity four-layer test board on a JEDEC 51-7 thermal measurement standard.  $\theta_{JC}$  is measured at the exposed pad of the package.
- Note 3.** Devices are ESD sensitive. Handling precaution is recommended.
- Note 4.** The device is not guaranteed to function outside its operating conditions.

## Typical Operating Characteristics

CV vs. Temperature

Charging Current vs. VBAT

Boost Efficiency vs. Load Current

Charger Efficiency vs. Charging Current

## Register Description

I<sup>2</sup>C Slave Address : 1011100 (5CH)

Name		Function	Addr	Reset
CORE_CTRL0		Control 0	0x00	0x00
Bit	Mode	Name	Reset Value	Description
7	R/W	RST_REG	0	All registers reset bit. 0: Don't reset all registers. 1: Reset all registers. (Notice: 1.This bit will be reset to "0" after reset procedure finish. 2. In high-impedance mode, this bit reset all registers after leave high-impedance mode.)
[6:0]	R/W	Reserved	0000000	Reserved

Name		Function	Addr	Reset
CHG_CTRL1		Control 1	0x01	0x10
Bit	Mode	Name	Reset Value	Description
7	R/W	SEL_SWFREQ	0	The switching frequency selection bit (Charger/OTG) 0 : The switching frequency is 1.5MHz. (Default) 1 : The switching frequency is 0.75MHz.
6	R/W	FIXFREQ	0	Charger switching frequency 0 : Charger switching frequency would be varied if VBUS is closed to VBAT(default) 1 : Charger switching frequency is fixed
5	R/W	Reserved	0	Reserved
4	R/W	STAT_EN	1	Charger STAT pin function 0 : Disable 1 : Enable (default)
3	R/W	IRQ_PULSE	0	IRQ reminder function 0 : IRQ reminder is disabled (default) 1 : IRQ reminder is enabled. If IRQ is triggered but no check action, INT pin will be released as well as being triggered again with every 2s intervals
2	R/W	HZ	0	High-impedance selection 0 : No high-impedance mode (default) 1 : High-impedance mode
1	R/W	OTG_PIN_EN	0	Boost mode enable with OTG pin 0 : Enable Boost mode by OPA_MODE (default) 1 : Enable Boost by both OPA_MODE bit and OTG pin
0	R/W	OPA_MODE	0	Boost mode enable 0 : Charge mode (default) 1 : Boost mode for OTG

Name		Function	Addr	Reset
CHG_CTRL2		Charger Control 2	0x02	0x07
Bit	Mode	Name	Reset Value	Description
7	R/W	SHIP_MODE	0	Shipping mode enable, force BATFET OFF 0 : Allow BATFET turn on (default) 1 : Force BATFET turn off
6	R/W	BATDET_DIS_DLY	0	BATFET turn off delay 0 : BATFET turn off immediately (default) 1 : BATFET turn off with 10s delay after SHIP_MODE bit is set
5	R/W	BYPASS_MODE	0	"Bypass mode enable, disable the buck but force BATFET on 0 : Bypass mode disable (default) 1 : Bypass mode enable"
4	R/W	TE	0	Termination enable 0 : Disable charge current termination (default) 1 : Enable charge current termination
[3:2]	R/W	IINLMTSEL	01	Input current limit selection bit 00 : Input limit is set as 3.25A 01 : CHG_TYP results is applied D+D- detection (default) 10 : IAICR[5:0] results is applied 11 : Input limit is set by the lowest among above
1	R/W	CFO_EN	1	Charger and OTG enable 0 : CFO is disabled 1 : CFO is enabled (default)
0	R/W	CHG_EN	1	Charger enable 0 : Charger is disabled 1 : Charger is enabled (default)

## Application Information

### Direct Charge

Transition from Fast Charge to Direct Charge :

(1) `BYPASS_MODE` = 1 (0x02, bit5), the switching charger is disabled, and the BATFET will be turned on to sustain the system loading to prevent shutdown.

(2) `VG_EN` = 1 (0x18, bit0), the internal charge pump is enabled to turn on the external NMOSFET, enabling the direct charge path, which is through PMID to BAT.

Transition from Direct Charge to Fast Charge :

(1) `VG_EN` = 0 (0x18, bit0), the internal charge pump is disabled, and the BATFET is kept turned on for continuous system operation.

(2) `BYPASS_MODE` = 0 (0x02, bit5), the switching charger is enabled.

Protections for Direct Charge

(1) UC : Low charge current (around 600mA) protection in direct charge mode against input source having been removed.

(2) OVP of Battery : 0x1B (bit 6-4) is for Battery-OVP-related setting, including this function is enabled or not and user-programmable VBATOVR range, from 104% to 119%.

(3) OVP of VBUS : 0x1D byte is for VBUS-OVP-related setting, including this function is enabled or not and user-programmable VBUSOV range, from 3.9V to 7V .

(4) OC : 0x1B (bit 3-0) is for direct-charge-current-related setting, including this function is enabled or not and user-programmable direct-charge over-current range, from 4A to 6.5A.

(5) Watch Dog Timer (WDT) : To prevent system from shutdown in direct charge status, the RT9468 also provide watch dog function which can set by 0x1C (bit 7 - 4).

(6) Protect deglitch time : The user-programmable deglitch time of the above protections can be set by 0x1C (bit 3 - 0)

### Switching Charger

The switching charger integrates a synchronous PWM controller with power MOSFETs to provide Minimum Input Voltage Regulation (MIVR), Average Input Current Regulation (AICR), high-accuracy current and voltage regulation, and charge termination. The charger also features OTG (On-The-Go) Boost Mode.

The switching charger has three operation modes: charge mode, boost mode (OTG-Boost), and high-impedance mode. In charge mode, the charger supports a precision charging system for single cell batteries. In boost mode, the charger works as a boost converter to boost the battery voltage back to the VBUS pin for sourcing OTG devices. In high-impedance mode, the charger stops charging or boosting and operates at a low current sinking from the VBUS pin or the battery to reduce power consumption when the device is in standby mode.

### Charge Mode Operation

#### Minimum Input Voltage Regulation (MIVR)

The switching charger features Minimum Input Voltage Regulation function to prevent input voltage drop due to insufficient current provided from the adapter or USB input. If MIVR function is enabled, the input voltage decreases when the over-current condition of the input power source occurs. The VBUS voltage is regulated at a predetermined voltage level which can be set as 3.9V to 13.4V per 0.1V by I2C interface. At this time, the current drawn by the switching charger equals to the maximum current value that the input power can provide at the predetermined voltage level, instead of the set value.

### Pre-Charge Mode

For life-cycle consideration, the battery cannot be charged with large current under low-battery condition. When the BAT voltage is below pre-charge threshold voltage, the charger is in pre-charge mode with a weak charge current, which equals to the pre-charge current.

There are two control loops in pre-charge mode : ICHG and SYSREG. If the battery voltage is lower than the SYS voltage, the MOSFET will not be fully turned on so that

the  $V_{SYS}$  is not equal to  $V_{BAT}$ . That is, the  $V_{SYS}$  can be powered from the buck rather than the low battery, which is in pre-charge mode. As a result, the system power can be guaranteed in this low-battery condition.

### Fast-Charge Mode and Settings

As the BAT voltage rises above  $V_{PRECHG}$ , the charger enters fast-charge mode and starts charging. Notice that the MUIC integrates input power source (AC adapter or USB input) detection. Thus, the switching charger can set the charge current via options automatically. Unlike the linear charger (LDO), the switching charger (buck converter) is like a current amplifier, where the current drawn by the switching charger is different from the current into the battery.

Average Input Current Regulation (AICR) level and output charge current ( $I_{CHG}$ ) can be set independently.

### Cycle-by-Cycle Current Limit

The switching charger has included a cycle-by-cycle current limit for output inductor. Once the inductor current reaches the current limit, the charger stops charging immediately to prevent from over-current condition and damaging the device. Note that this protection can never be disabled.

### Average Input Current Regulation (AICR)

The AICR levels can be set via the I<sup>2</sup>C interface. For example, AICR100 mode limits the input current to 100mA, and AICR500 mode to 500mA. This function can be disabled, if not needed. The AICR current levels are in the range of 100mA to 3250mA with a resolution of 50mA.

### Average Input Current Level (AICL)

The AICL levels can be set via the I<sup>2</sup>C interface (0x0E[7:0]). When IAICR is set to large current and the VBUS voltage drops to the VMIVR level, AICL measurement mechanism will decrease IAICR level step by step automatically until the VBUS voltage exceeds AICL threshold voltage.

### Charge Current ( $I_{CHG}$ )

The charge current into a battery is determined by the power path sensing  $R_{on}$  and  $I_{CHG}$  setting by I<sup>2</sup>C. The voltage between the SYS and BAT pins is regulated to the voltage control by  $I_{CHG}$  setting and the fast-charge currents are 100mA to 5000mA in a step of 100mA, programmed by I<sup>2</sup>C.

### Constant Voltage Mode

The switching charger enters constant voltage mode when the BAT voltage is closed to the output-charge voltage ( $V_{OREG}$ ). In this mode, the charge current begins to decrease. For default settings (charge current termination is disabled), the switching charger does not turn off and always regulates the battery voltage at  $V_{OREG}$ . However, once the charge current termination is enabled, the charger terminates if the charge current is below termination current ( $I_{EOC}$ ) in constant-voltage mode. The output-charge voltage is set by the I<sup>2</sup>C interface. Its range is from 3.9V to 4.71V in a step of 10mV.

### End-of-Charge Current ( $I_{EOC}$ )

If the charger current termination is enabled, the end-of-charge current is determined by the termination current sense voltage ( $V_{EOC}$ ).  $I_{EOC}$  is set by the I<sup>2</sup>C interface from 100mA to 850mA in a step of 50mA.

### Charge Trip

When input power source is plugged in, the RT9468 checks the current sourcing capability of the input power source when  $V_{BUS}$  exceeds 3.3V. The following conditions should be met to start battery charge.

1.  $V_{BUS}$  is below 14V (i.e.  $V_{BUS\_OVP}$ ).

	Battery Voltage Level $V_{BAT}$	Battery Charge Current $I_{BAT}$
Trickle mode	$V_{BAT} < 2V$	100mA
Pre-charge mode	$V_{BAT} < V_{PREC}$ (0x08, bit[7:4])	$I_{PREC}$ (0x08, bit[3:0])
Fast-charge mode	$V_{BAT} < V_{OREG}$ (0x04, bit[7:1])	Charge current is determined by several control loops
End-of-charge mode	$V_{BAT} = V_{OREG}$ (0x04, bit[7:1])	Charge current decreases naturally

2.  $V_{BUS}$  is above 3.8V (i.e.  $V_{BAD\_ADP}$ ) when sinking 50mA (i.e.  $I_{BAD\_ADP\_SINK}$ ) during 30ms of detection period,  $t_{BADADP\_DET}$ . And this detection function can be disabled by ADP\_DIS (0x0B, bit7) register bit.

The charge modes as below, and the charge mode which the charger operates in will be determined according to the  $V_{BAT}$  level :

In fast-charge mode, the input current limit can be selected by IINLMTSEL (0x02, bit[3:2]). This flexible setting is suitable for wide applications of adapters. In addition, the RT9468 also provides charger warning statuses, such as MIVR, AICR and TREG (0x50, bit[6:4]), to host.

There are 2 register bits, related to the LX switching of the RT9468 :

1. SEL\_SWFREQ (0x01, bit7) :
  - ▶ If SEL\_SWFREQ is disabled (set to 0), the switching frequency is 1.5MHz (default).
  - ▶ If SEL\_SWFREQ is enabled (set to 1), the switching frequency is 0.75MHz.
2. FIXFREQ (0x01, bit6) :
  - ▶ If FIXFREQ is disable (set to 0), the charge switching frequency would be varied when  $V_{BUS}$  is closed to  $V_{BAT}$ .
  - ▶ If FIXFREQ is enable (set to 1), the charger switching frequency is fixed.

There are 3 enable bits, related to the charger.

1. CFO\_EN (0x02, bit1) : This bit is used to enable or disable the charger and boost.
2. CHG\_EN (0x02, bit0) : When CHG\_EN bit is disabled, power path MOS will be turned off so that the zero charging current is derived. At this time, input power source continuously delivers power to the system without charging the battery. However, if the system load is larger than the input source current limit, the power path MOS will be turned back on immediately to

supply power to system. The CHG\_EN bit function is same as CEB pin.

3. HZ (0x01, bit2) : When HZ bit is enabled, the most of the charger internal circuits will be turned off in order to reduce quiescent current.

In end-of-charge mode, if EOC\_EN (0x09, bit3) is enabled, once the charge current is lower than IEOC (0x09, bit[7:4]) level and within CHG\_TEDG\_EOC (0x09, bit[2:0]), the RT9468 will send out INT and CHG\_IEOC1 = 1 (0x54, bit7). Then, the RT9468 will start to check statuses of the following three bits.

1. TE (0x02, bit4) : If this bit is enabled, the power path will be turned off, and the buck of the charger will keep providing power to the system.
2. EOC\_TIMER (0x07, bit[1:0]) : With CHG\_IEOC1 = 1, the power path will not be turned off. The RT9468 can keep charging the battery for 30 to 60 minutes to extend battery charging capacity.
3. BATD\_EN (0x0B, bit6) : After charge is done, the RT9468 will start to sink a sink current of  $I_{BAT\_SINK}$  375 $\mu$ A for about 256ms from the battery. If  $V_{BAT}$  drops to trigger the recharge function, it is to say the battery is not connected to the charger. The RT9468 will continue on battery detection for every two seconds.

### OTG Mode

The RT9468 also supports OTG mode. It not only provides several output current limit protection levels, but also has low battery protection for overall system considerations. The RT9468 can select switching frequency via SEL\_SWFREQ (0x01, bit7), whether the RT9468 already operates in OTG mode or not.

There are two ways to enable OTG mode :

1. By way of software : through I<sup>2</sup>C to set OPA\_MODE (0x01, bit0).

2. By way of hardware : through I<sup>2</sup>C to set OTG\_PIN\_EN (0x01, bit1) and OPA\_MODE (0x01, bit0). Users can then use GPIO to change the OTG pin level to enter / exit OTG mode.

The RT9468 also provides UUG\_ON (0x0D, bit1) bit, which can be applied to different applications

1. If OTG mode and UUG\_ON are enabled, the boost-mode output is on the VBUS pin, which can be used for OTG (On-the-Go) mode in mobile phones.
2. If OTG mode is enabled and UUG\_ON bit is disabled, the boost-mode output is on the PMID pin, which can be used in power banks, that is, adapter power can be delivered to PD (Powered Device) directly.

## Shipping Mode

From manufacture to an end user, it may take long time for products to travel. In view of this, the RT9468 provides shipping mode to further minimize battery leakage. After enabling SHIP\_MODE (0x02, bit7), the RT9468 will shut down internal circuits to reduce quiescent current. The delay time for BATFET to be turned off can be selected by BATDET\_DIS\_DLY (0x02, bit6). Below list several ways to exit shipping mode.

1. Input power source is plugged in.
2. Disable SHIP\_MODE bit.
3.  $\overline{\text{QON}}$  pin is pulled from Logic High to Logic Low within 1 second.
4. Enable RST\_REG (0x00, bit7) to reset all registers to default values.

## MeidaTek Pump Express+ (MTK, PE+)

The RT9468 can provides an input current pulse to communicate with an MTK-PE+ high voltage adapter. When EN\_PUMPX (0x19, bit7) is enabled, the host can increase or decrease adapter output voltage by setting PUMPX\_UP\_DN to the desired value. After enabling either one of them, the RT9468 will generate a VBUS current pattern for the MTK-PE+ adapter to automatically identify whether to increase or decrease output voltage (VBUS pin). Once the current pattern is finished, INT will be triggered accordingly to request the processor to read the registers.

## JEITA Protection

JEITA protection is implemented in the RT9468 to achieve battery thermal protection. JEITA guidelines were released in 2007. It includes warm and cool protection (Cool section is between T1 and T2; warm section is between T3 and T4, see the figure below). When battery temperature is in warm section, the RT9468 will lower the charge voltage (V<sub>OREG</sub>) by 200mV. If the battery is in cool section, the charger will reduce charge current (by half of CC mode current). The RT9468 will stop charging the battery if the battery temperature is lower than T1 or higher than T4.

Thermal condition of a battery can be monitored by TS pin. There are four sections which are implemented for JEITA protection. Based on R<sub>HOT</sub> and R<sub>COLD</sub>, R<sub>T1</sub> and R<sub>T2</sub> can be calculated with equation (1) and equation (2). Herein, R<sub>HOT</sub> is the NTC resistance of the battery over-temperature threshold, and R<sub>COLD</sub> is the NTC resistance of the battery under-temperature threshold.

$$R_{T1} = V_{REGN} \times \left[ \frac{(1/V_{T1} - 1/V_{T4})}{(1/R_{COLD} - 1/R_{HOT})} \right] \quad (1)$$

$$R_{T2} = R_{T1} \times \left[ 1 / (V_{REGN} / V_{T1} - R_{T1} / R_{COLD} - 1) \right] \quad (2)$$

The respective percentages of the voltages at T1~T4 are shown in the following table.

No.	Parameter	Symbol	Condition	$\frac{V_{TS}}{V_{REGN}}$	Units
1	T1 (0°C) Threshold	$V_{T1}$	$V_{TS}$ rising, as percentage to $V_{REGN}$	73.5	%
2	T1 Hysteresis	$V_{T1\_HYS}$	Hysteresis, $V_{TS}$ falling	2	%
3	T2 (10°C) Threshold	$V_{T2}$	$V_{TS}$ rising, as percentage to $V_{REGN}$	68.5	%
4	T2 Hysteresis	$V_{T2\_HYS}$	Hysteresis, $V_{TS}$ falling	2	%
5	T3 (45°C) Threshold	$V_{T3}$	$V_{TS}$ falling, as percentage to $V_{REGN}$	45	%
6	T3 Hysteresis	$V_{T3\_HYS}$	Hysteresis, $V_{TS}$ rising	2	%
7	T4 (60°C) Threshold	$V_{T4}$	$V_{TS}$ falling, as percentage to $V_{REGN}$	34.5	%
8	T4 Hysteresis	$V_{T4\_HYS}$	Hysteresis, $V_{TS}$ rising	2	%

### Analog IR Drop Compensation

Since resistance between charger output and battery cell terminal will force to move from constant current mode to constant voltage mode too early and increase charging time. To speed up charging cycle, RT9468 provides analog IR drop compensation function to delivery maximum power to battery for extend constant current mode charging time. Host(AP) can set IR compensation function by BAT\_COM (0x1A bit[5:3]) and VCLAMP (0x1A bit[2:0]).

$$V_{ACTUAL} = V + \min(I_{CHG\_ACTUAL} \times BAT\_COM, V_{CLAMP})$$

### CHG\_STAT

There is one way to check RT9468's status :

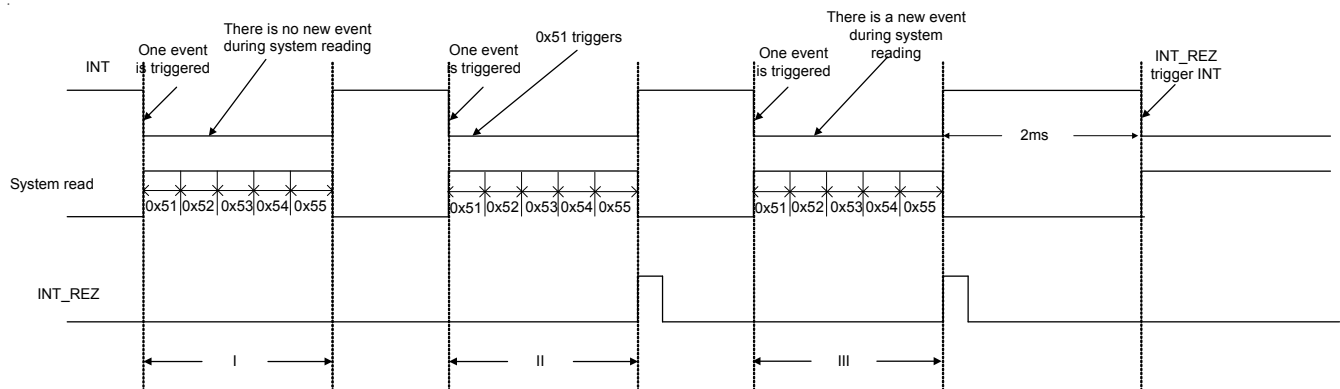

The RT9468 status is indicated in the register of address 0x42 as below.

- ▶ CHG\_STAT : Charger status
- ▶ BOOST\_STAT : Boost mode status
- ▶ ADC\_STAT : ADC status. Check whether ADC is active or idle

## Interrupt

The RT9468 reports status to host (CPU, MCU, EC, or...etc.) by the INT (interrupt to host) pin, which is an open-drain output. The INT pin goes low when any fault occurs. It will be automatically reset when all the fault flags are cleared. The IRQ\_PULSE (0x01, bit3) provides a reminder function. If the system interrupts by the interrupt signal but does not take any action to check the registers, the INT pin will be released with every 2 seconds and be triggered again.

The RT9468 INT pin is used to indicate whether the any charging events occur. When AP (Access Point) detects a falling edge on the INT pin, AP starts to read the INT register 0x51 to 0x58 sequentially. However, if any of the events is triggered again during this checking period, it will be a miss. If any of the INT registers does not be checked, the INT\_REZ bit can help release the INT pin with 2ms then reset it again in order to remind host the missing events again.

## ILIM Pin

For hardware protection, the RT9468 supports input current limit setting on the ILIM pin by way of a resistor from ILIM pin to ground.

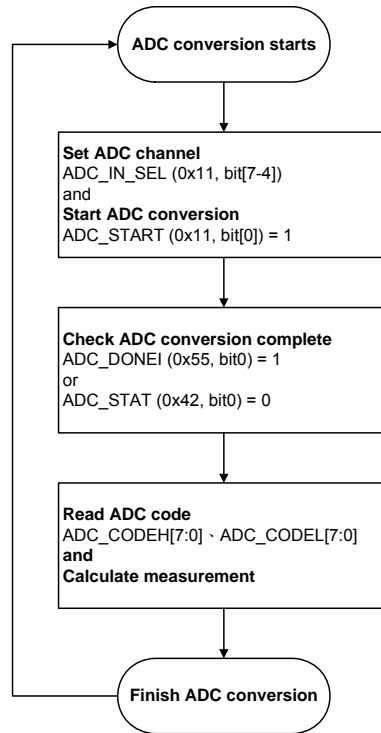

$$I_{INMAX} = K_{ILIM} / R_{ILIM}$$

For example, if the input current limit is to be set as 2A with a typical input current limit factor  $K_{ILIM}$  as 355AΩ, a resistor of 180Ω will then be chosen as the resistor from the ILIM pin to ground. The actual input current limit is the minimum between the result of IINLMTSEL (0x02, bit[3:2]) and ILIM.

## ADC Conversion Operation Flow

The figure below shows the flow chart of ADC conversion operation. ADC conversion starts from selecting an ADC channel by setting ADC\_IN\_SEL (0x11, bit[7:4]) and enabling ADC\_START (0x11, bit0). After about 200ms of ADC conversion time for a conversion to be completed, ADC\_DONEI (0x55, bit0) will be enabled and ADC\_STAT (0x42, bit 0) will be disabled. The host can be informed that ADC conversion is completed by reading the register bits.

The host can read ADC high-byte codes from ADC\_CODEH (0x44, bit 7-0) and low-byte codes from ADC\_CODEL (0x45, bit 7-0) to calculate the measured voltage /current /temperature data with respect to each ADC channel. The table below shows measurement equations for various ADC channels. When measuring IBUS, the AICR setting need large 350mA at least. When measuring IBAT, the ICHG setting need large 1A at least.

ADC Channel	Measurement Equation	Measurement Range
VBUS_DIV5	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 25mV$	1V to 22V
VBUS_DIV2	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 10mV$	1V to 9.8V
VBAT/VBATS	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 5mV$	0V to 4.9V
VSYS	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 5mV$	0V to 4.9V
REGN	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 5mV$	0V to 4.9V
TS_BAT/TS_BUS	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 0.25\%$	0% to 100%
IBUS IAICR[5:0] setting < 400mA	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 50mA \times 0.67$	0A to 0.4A
IBUS IAICR[5:0] setting ≥ 400mA	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 50mA$	0A to 5A
IBAT / IBATS ICHG[5:0] setting 100mA to 450mA	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 50mA \times 0.57$	0A to 0.45A
IBAT / IBATS ICHG[5:0] setting 500mA to 850mA	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 50mA \times 0.63$	0A to 0.85A
IBAT / IBATS ICHG[5:0] setting ≥ 900mA	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 50mA$	0A to 5A
TEMP_JC	$[(ADC\_CODEH \times 256) + ADC\_CODEL] \times 2^{\circ}C - 40^{\circ}C$	-40 to 120°C

## I<sup>2</sup>C Interface Timing Diagram

The RT9468 acts as an I<sup>2</sup>C -bus slave. The I<sup>2</sup>C -bus master configures the settings for charge mode and boost mode by sending command bytes to the RT9468 via the 2-wire I<sup>2</sup>C -bus. After the START condition, the I<sup>2</sup>C master sends

a chip address. This address is seven bits long followed by an eighth bit which is a data direction bit (R/W). The second byte selects the register to which the data will be written. The third byte contains data to the selected register.

## Thermal Considerations

The junction temperature should never exceed the absolute maximum junction temperature  $T_{J(MAX)}$ , listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where  $T_{J(MAX)}$  is the maximum junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Operating Conditions is 125°C. The junction-to-ambient thermal resistance,  $\theta_{JA}$ , is highly package dependent. For a WQFN-32L 4x4 package, the thermal resistance,  $\theta_{JA}$ , is 27.8°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated as below :

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (27.8^\circ\text{C/W}) = 3.59\text{W for a WQFN-32L 4x4 package.}$$

The maximum power dissipation depends on the operating ambient temperature for the fixed  $T_{J(MAX)}$  and the thermal resistance,  $\theta_{JA}$ . The derating curves in Figure 1 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

Figure 1. Derating Curve of Maximum Power Dissipation

## Layout Consideration

The RT9468 layout guideline is shown as follow. There are several suggestion are provided.

- ▶ AGND should be connected to PGND at GND plane.
- ▶ The capacitor of PMID should be as close as possible to RT9468 for reduce EMI.
- ▶ The GND path of PMID and VBUS capacitor needs to connect directly at TOP layer.
- ▶ PGND connects to thermal heat sink can improve thermal performance.
